

## FINAL REPORT FRONT\_END TEAM 7

### Members:

**Medhashakti Khatri**

**Janice Johnson C.**

**Nimisha George**

**Atharva Chiplunkar**

**Swarangi Bane**

- **Problem Statement:**

Clone of PooCoin DApp. POOCOIN is used to unlock features on the PooCoin DApp for portfolio management and token price charging. It shouldn't be exactly the same but all functionality should be covered.

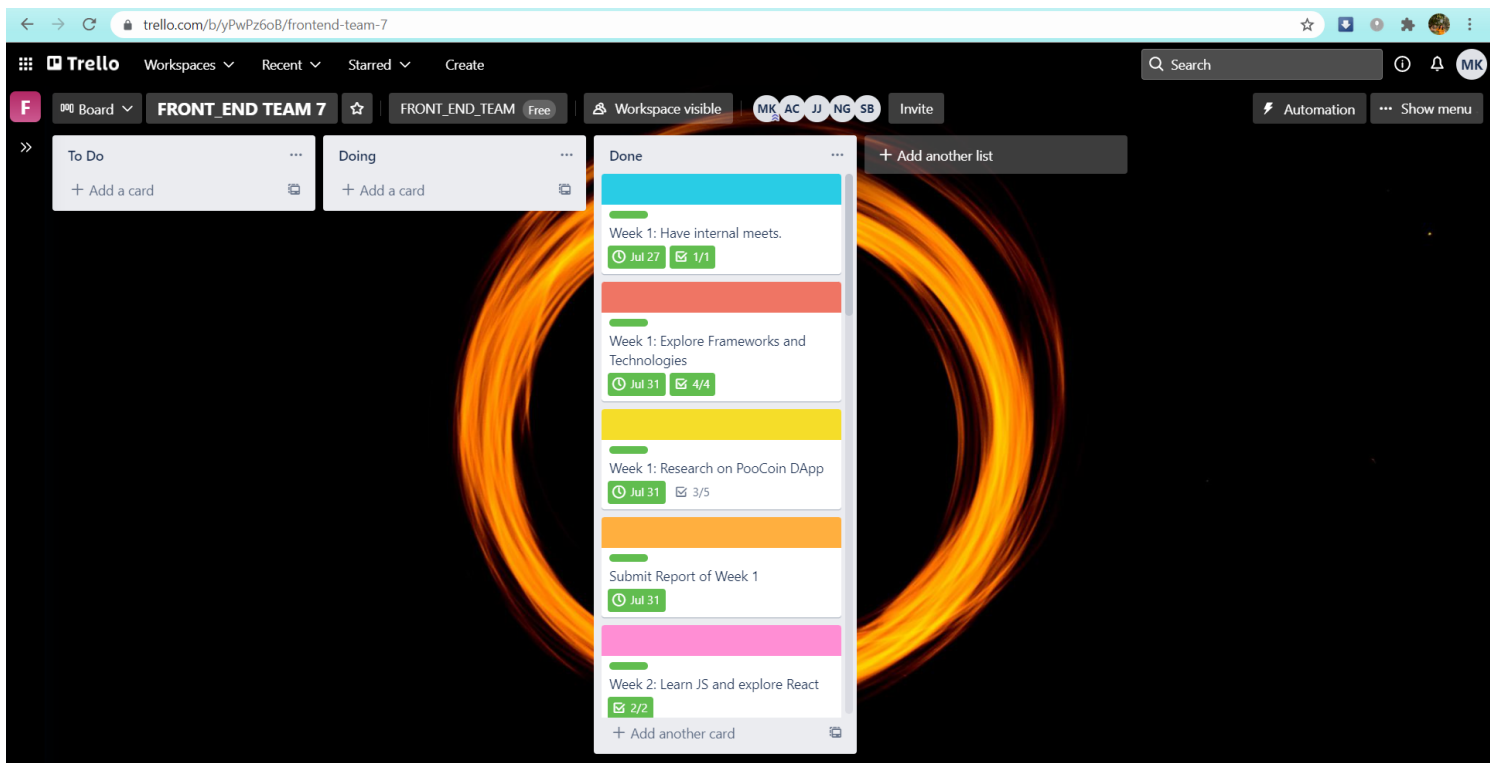

- **Final Report**

- We started by learning more about JS, brushing up our HTML, CSS in the initial weeks. Side by side we explored Discord, Trello, Git, GitHub, React, PooCoin DApp.
- Our main aim was to learn and understand React as we were not familiar with it. We learnt that React JS is a very competent dynamic application for preparing larger web apps in a coordinated, flexible way where application UIs can be designed in a scalable and swift manner.
- It is a declarative, efficient JavaScript framework to build interactive user interfaces (UI) with greater ease and flexibility. It provides many advantages in designing simple views for different states in an application and greater ease in updating and rendering the right components efficiently just when the data changes.
- We saw various youtube\udemy tutorial videos to understand in depth about the topic and how to incorporate it in our website.
- We started distributing pages, navbars and working on them and uploaded our progress on GitHub every step of the way.
- Finally, we completed the project as much as possible from our end and updated Trello board as well as GitHub.

- **Acknowledgement:**

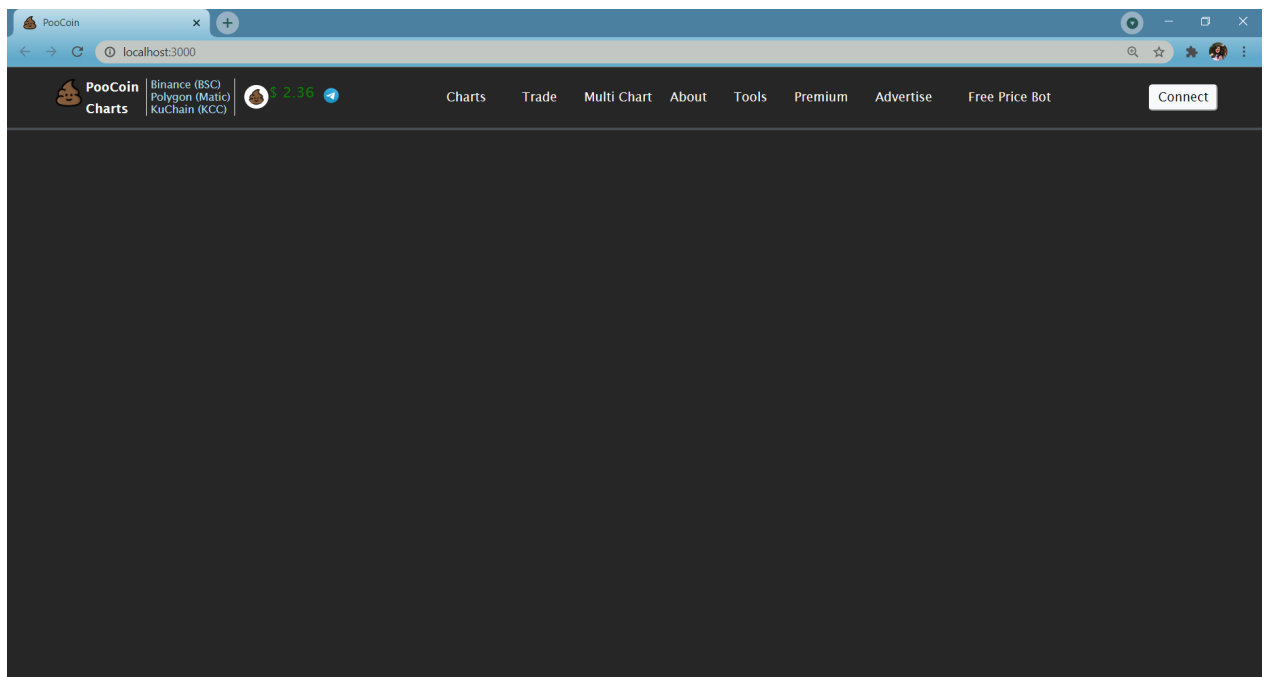

We would like to thank KubixSquare for providing us with this opportunity. Throughout this course of 8 weeks we were able to learn a new technology which will be really helpful for the development of our future along with that we learnt an important aspect of team building, working together as a team and sharing our thoughts and ideas.
